

## ABSTRACT

An interlabial pad, which can be discarded by flushing down a toilet and yet with which neither the functions and comfort during use of the interlabial nor the functions of a septic tank are damaged, is provided.

5 The interlabial pad comprises: an absorbent body absorbing liquids; and a cover body covering the absorbent body in an enclosing manner and comprising a liquid permeable surface side sheet and a liquid impermeable back face side sheet. The cover body is arranged from a plurality of small sheet pieces and the small sheet pieces that are adjacent each other are  
10 mutually overlapped and form seam parts. The abovementioned seam parts are set so as to become weakened in physicochemical strength upon permeation of water and separate into the plurality of small sheet pieces when the interlabial pad is discarded by being flushed down a toilet.
